

SESSION7

Adaptive approaches:

**Evaluation in crises & evaluation
in hard-to-reach areas - HRA**

Adaptive evaluation approaches: Session Outline

Adaptive evaluation approaches:

- Evaluation in hard-to-reach areas
- Evaluation in crises

Evaluation in Hard-to-Reach Areas

Constraints, techniques, and ethical
aspect

What are “hard-to-reach areas”?

- Around 2 billion people and half of the world's poor live in fragile or conflict-affected states (FCAS)
- 2016: EU's development cooperation with FCAS represented 52.8% of total DEVCO/INTPA commitments.
- 2019: commitments of DAC members to FCAS = 60% of overall expenditure.
- Logistic and security risks make the travel to some areas of FCAS particularly challenging – sometimes impossible.

What are “hard-to-reach areas”?

- Apart from FCAS there are other areas where traveling is particularly challenging:
 - ✓ Post-disaster areas (*natural, man-made*)
 - ✓ Areas with other physical, logistical, security or health-related obstacles
- We define these regions of the world as “**Hard-to-reach areas**”.
- This definition includes but is larger than FCAS

What about evaluations in HRA?

- A traditional approach to evaluation in hard-to-reach areas is destined to fail:
 - ✓ professional evaluators available to travel to these areas is limited
 - ✓ security risks make conventional field missions unrealistic
- **There are very few INTPA evaluations in these areas**
- However, there are solutions, requiring the use of specific methodologies and tools
- They are being used for a few years by different agencies
- They are innovative in an evaluation context, but experience is growing

Cycle of conferences

Evaluation in hard-to-reach areas

In 2019 the ESS of DG INTPA organized a cycle of conferences to share with INTPA/EUD staff and the global evaluation communities some lessons from the use of these techniques.

Ultimate goal: to encourage OMs in Delegations and HQ to evaluate their interventions in hard-to-reach areas by calling on their evaluators to use suitable evaluation techniques that have been tried and tested by other agencies in similar contexts.

Cycle of conferences

Evaluation in hard-to-reach areas

Some lessons from this initiative

(final stock-taking paper, video recordings, slides, reference literature are [accessible from here](#))

Use of geo-spatial data

- Satellite data for both outputs and outcomes analysis
- Of immediate application in some contexts (*land use and planning, forestation, agriculture, environmental projects...*)
- Require substantial interpretation work when applied to other contexts (*migration, impact of civil infrastructures on wealth of local populations...*)
- Sometimes they can support analysis in unexpected fields (*violent extremism...*)
- Important to validate findings with field visits
- No need for skilled evaluators for validation work

Use of geo-spatial data

The resolution of free satellite images increased enormously over time (from 250 to 10 m)

Commercial satellites deliver images with even higher definitions (up to some cm), but their cost is extremely high and the coverage may be lower.

Use of geo-spatial data

Satellite data are available in **time series**

- They allow changes over time to be seen
- They allow missing baselines to be reconstructed (*with limitations*)
- Important analysis work is needed to interpret data

Public satellite data are free; main providers are:

- Copernicus (delivering also 6 core services: Climate Change, Marine Monitoring, Atmosphere Monitoring, Land Monitoring, Security, Emergency Management)
- NASA

Example in Mali, conflicts impacts perceived from satellites:

Mobile-phone based feedback mechanisms

- Allow gathering of a large amount of data
- Used to administer:
 - ✓ SMS-based surveys
 - ✓ Messaging-based surveys (*require smartphones*)
 - ✓ Interactive voice recording surveys
 - ✓ Interviews through call centers
- Benefits
 - ✓ Mobile phones are widespread, easy to use and cheap
 - ✓ No need to use smartphones for SMS surveys
 - ✓ Versatility
- Problems
 - ✓ Bias towards phone owners
 - ✓ Literacy bias (*for text surveys*)
 - ✓ Privacy risks
 - ✓ Trust

Surveys by local enumerators

- Administered in the field, face-to-face
- Allow gathering of a large amount of data
- Can be administered by local enumerators
- Require preparation and training time
- Different supports to be used depending on security conditions
 - ✓ Tablets
 - ✓ Smartphones
 - ✓ Paper-based

Surveys by local enumerators

Surveys with tablets / smartphones

- Specialised software allows offline data entry – online transmission or online-online
- Handhelds and software are cheap
- Data collection is fast
- Data automatically transmitted to server
- Post-collection processing is largely automatic, fast, reliable – but requires control
- Handhelds are reusable
- Requires logistic planning
- Discreet but visible; smartphones are less visible than tablets
- **Not to be used in case of security threats, where these tools are banned or culturally inappropriate**

Surveys by local enumerators

Paper-based surveys

- To be used when use of handhelds is not advisable
- Not exempt from risks in extreme situations
- Lengthier data collection process
- Very time absorbing post-collection process

Surveys by local enumerators

Tablets, smartphones, paper: some common issues, different solutions

- Data anonymization is imperative, irrespective of the tool used
- Data to be destroyed in case of hostility: easy with handhelds, more difficult with paper
- Verification of the work of enumerators: easy with geo-tracking in secure environments, need for random phone calls or a ghost coordinator in insecure environments

Further opportunities

Radio programmes; to inform local beneficiaries of a survey, providing them with contacts for complaining with the work of surveyors etc.

Monitoring of social platforms; additional method to inform about a survey, gathering and analyzing reaction to an event etc.

Additional, non-tech opportunities exist and proved very effective in some contexts (*children's drawings...*)

Situation in constant evolution

What we have learnt (1)

- **Never, ever, under any circumstance put at risk the security of beneficiaries and of surveyors – not even sub-consciously**
- Need for trade-offs between data robustness and no evidence at all
- Limits and reliability of the evaluation to be acknowledged and reported
- Adequate preparation time to be planned for in the ToR
- ToR must already include indications of the approach we seek; timeline and efforts must be consequent: the ESS is here to help!

What we have learnt (2)

- Some common ToR underestimations:
 - ✓ Non provision for context-specific methods
 - ✓ Preparation time (including tool development)
 - ✓ Training time of enumerators
 - ✓ Time for developing the surveys
 - ✓ Time for data processing
 - ✓ Expertise for statistical / image analysis
 - ✓ Equipment costs (if needed)
- Never rely on one single method of evidence gathering: this is always true, more so when evaluating in these contexts
- Don't over-focus on technologies: they are a means to achieve an end, not an end *per se*

What we have learnt (3)

- When evaluating in FCAS (Fragile and Conflict Affected States), **conflict sensitivity** is a **further evaluation criterion**
- All interventions in FCAS should be designed with conflict sensitivity in mind but this is not always the case.
 - ✓ Even in these cases, conflict sensitivity can and should be assessed

A cartoon illustration of a lion with a pink face and a yellow mane, wearing a yellow tunic. The lion is holding a black cord in its right paw and has its left paw raised, pointing towards the top of the slide.

Eval In Crises

An ESS initiative for EC evaluation in times of pandemics, but not only!

EvalInCrisis, an adaptive initiative from ESS

- COVID-19: this global crisis teaches us how fragile we are, as individuals and as societies
- It introduced profound changes in our lives; we shall embrace them and adapt our working habits
- This has several impacts also on evaluation
- The global evaluation community is developing references, reflections, tools to help commissioners of evaluation and evaluators
- #EVALCRISIS is an INTPA/ESS initiative, which gathers and shares useful references, and produces original reflections (podcasts, blog posts)
- Follow the initiative on <https://europa.eu/capacity4dev/devco-ess>
- [Register here](#) to receive our bi-weekly newsletters
- INTPA staff with evaluations planned for 2020? Contact helpdesk@evaluationsupport.eu to receive personalized support: go/do not go decision, tools, methods...

Q&A session
