- When all is filled → CONFIRM

- 1. Can be edited or deleted (as just created, everything can be possible \rightarrow never approved)
- 2. The Baseline and Target
- 3. A visual representation (for quantitative indicators only)
- 4. The Target achievement (will be explained later)

Intermediate Targets

Intermediate Targets

- Intermediate targets (milestones) are necessary to ensure meaningful performance scores for quantitative indicators, visualised as the Effectiveness Score.
- Performance at the indicator level can be assessed by comparing the current value (actual) with the intermediate target (expected) for the same date.
- No intermediate targets are added for impact-level indicators as they are not directly attributable to the implementation.
- Intermediate targets are automatically generated for every June 30 and December 31 date between the baseline and final target dates.
- Defining and encoding customised intermediate targets for outputs and outcomes can be laborious.
- The automatically generated intermediate targets are created and updated whenever "Save as Draft" is pressed in the Manage Logframe mode.

 For output-level indicators, intermediate targets are generated by using a linear function between the baseline date and value, and the final target date and value.

- For outcome-level indicators, which typically progress non-linearly, the outcome profile must be specified, but the profile type can be adjusted later if needed.
- Three non-linear profiles are suggested for automatic intermediate target generation. The outcome profiles are:

Results versus Targets Timeline

a. Steady progress: The outcomes are achieved continuously throughout the second half of implementation.

- For outcome-level indicators, which typically progress non-linearly, the outcome profile must be specified, but the profile type can be adjusted later if needed.
- Three non-linear profiles are suggested for automatic intermediate target generation. The outcome profiles are:
- b. Accelerating progress: The outcomes are achieved towards the end of the second half of implementation.

- For outcome-level indicators, which typically progress non-linearly, the outcome profile must be specified, but the profile type can be adjusted later if needed.
- Three non-linear profiles are suggested for automatic intermediate target generation. The outcome profiles are:

Results versus Targets Timeline

c. No progress until end (of the intervention): The outcomes are mostly achieved at the end of the second half of implementation.

- For outcome-level indicators, which typically progress non-linearly, the outcome profile must be specified, but the profile type can be adjusted later if needed.
- Three non-linear profiles are suggested for automatic intermediate target generation. The outcome profiles are:
- d. None of the above: Intermediate targets will have to be encoded manually.
- When no intermediate target is encoded manually, then the same approach will be taken by the system by default, as for output level indicators, which is a linear one but starting from the baseline date.

Please note that these automatically generated intermediate targets can always be modified later if needed, either collectively by changing the outcome profile selection or individually by changing specific intermediate targets.

 Selected at the beginning for a new logframe and can be changed via the "Outcome Profile Selection" button

Outcome Profile Selection Form

A logframe provides data on target achievement that is used for performance measurement. To ensure meaningful performance scores, intermediate targets (milestones) are necessary. For outputs, these are automatically generated, assuming linear progression between baseline and target. However, for outcomes, which usually progress non-linearly, three non-linear profiles are suggested for automatic intermediate target generation. The outcome profile must be specified initially but can be changed later. Additionally, the automatically generated intermediate targets can be revised or removed as required.

Please select the outcome profile *

Starting from halfway through implementation, which of the following profiles best describes the expected progress in the achievement of outcomes*?

*Outcomes refer to the changes expected from the intervention. These can be changes in individuals, systems, policies, or institutions. They may reflect shifts in relationships, knowledge, awareness, capabilities, attitudes, and/or behaviors. Outcomes are only indirectly controlled by the intervention implementers.

(a) <u>Steady progress</u>: The outcomes are achieved continuously throughout the second half of implementation.

O b. Accelerating progress: The outcomes are achieved towards the end of the second half of implementation.

O c. No progress until end: The outcomes are mostly achieved at the end of the second half of implementation.

O d. None of the above: Intermediate targets will be encoded manually.

 Select profile most relevant for MOST outcome level indicators and manually adjust where necessary.

NOT for FPI-funded Interventions
